What Will an Appreciation of China’s Currency Do to Inward and Outward FDI?

Karl Sauvant and Ken Davies

Abstract: What will an appreciation of the Chinese currency do to China’s direct investment? The discussion so far has been almost exclusively about the impact on China’s trade balance. This article argues that it is at least as important to see what effect it may have on the country’s inward foreign direct investment, which plays such a crucial role in China’s economic development, and its outward FDI, which is receiving increased attention worldwide.¹

Key words: Chinese currency, appreciation, FDI, traded balance

1. Overview

China has been the developing world’s largest recipient of IFDI since the mid-1990s, attracting US$95 billion in 2009.² A revaluation of the yuan will make it more expensive for foreign firms to establish themselves (or expand) in China (the world’s most dynamic market), giving an advantage to foreign firms already established there over new entrants. At the same time, exports of foreign affiliates, which account for 54% of total exports,³ will become less competitive internationally, although the increased costs will be partly offset by lower costs of imported inputs. Foreign affiliates can also expect to repatriate higher profits from sales in China in terms of their own currencies.

However, the most notable development of recent years has been the take-off of the country’s OFDI since
the government in 2000 adopted the “go global” policy encouraging Chinese firms to invest overseas.\(^4\)
China’s OFDI doubled from US$12 billion in 2005\(^5\) to US$27 billion in 2007, and then doubled again the
following year, to reach US$56 billion.\(^6\) Outflows continued to rise to $57 billion in 2009, even as world
FDI flows collapsed by 50%. In 2009, China was the world’s fifth largest outward investor.

The increasing international competitiveness of Chinese firms and an encouraging government policy
have been the main drivers of this surge. The 20% revaluation of China’s currency against the US dollar in
2005-2008 undoubtedly provided a favorable condition facilitating this in the case of host countries whose
currencies did not also appreciate against the US dollar. There is ample evidence in the academic literature
that a weaker exchange rate induces increased IFDI.\(^7\) China’s OFDI is poised to grow sharply again in
2010, judging by the first half of the year, when it was rising at an annual rate of 44%.\(^8\) Revaluation
would accelerate this trend. This is precisely what happened with Japan after the yen was revalued by over
50% against the US dollar between 1985 and 1987, following the 2005 Plaza Accord.\(^9\) Japan’s OFDI
tippled from US$6.5 billion in 1984 to US$19.5 billion in 1986, peaking at US$48 billion in 1990.\(^10\)

2. IFDI, OFDI and Chinese currency

A renewed yuan appreciation would boost China’s OFDI growth even further by lowering the cost of
overseas assets for Chinese firms, which have strong cash reserves from both retained earnings and large-
scale state credit allocations that put them in a position to invest internationally. Like competitors
elsewhere, they need to invest abroad to acquire a portfolio of locational assets to protect and increase
their international competitiveness through better access to skills, technology, natural resources, and

markets. Revaluation would combine with already rising wage pressures inside China. Labor-intensive firms in China’s coastal provinces are under pressure to seek lower labor cost by either investing in China’s interior of abroad. Already more than 700 Chinese affiliates have been established in Vietnam. Revaluation would push even more in that direction.

Suspicions of non-commercial motivations behind China’s OFDI are widespread because most of the country’s OFDI is by state-owned enterprises (SOEs). However, there is no systematic evidence that China’s SOEs, like their counterparts elsewhere, are driven by more than normal commercial considerations. At the same time, private or semi-private entities have been investing abroad. As their operations are less visible, it is likely that their OFDI, and therefore China’s total OFDI, is understated.

Fears of Chinese OFDI, as of Japanese and Korean investment in earlier decades, are misplaced. It is good for China and for host countries: Chinese FDI, like all FDI, can bring to host countries a bundle of tangible and intangible assets needed for economic growth and development. While a good part of China’s OFDI initially takes the form of trade-supporting FDI, it can be expected to lead relatively quickly to a shift of some production out of China, including to the US and Europe, thereby reducing exports from China. Moreover, OFDI is a key mechanism for integrating China into the world economy and making it a responsible stakeholder in it.

3. Summary notes

Chinese firms will have to learn from the past mistakes of other emerging multinationals about how to operate in the highly sophisticated developed-country markets and in developing countries. They need not only to overcome the “liability of foreignness” that any multinational faces when establishing itself in a foreign market, but they also need to overcome the “liability of the home country”. In particular, they need to establish a good social brand name so that they are seen as making not only a positive economic contribution to their host countries, but are also seen as good corporate citizens. The Chinese government can play a crucial role by adopting a code of conduct for all Chinese enterprises investing abroad, in line with internationally accepted norms and taking into account the increasing importance of sustainable FDI. For their part, host countries need to accept the “new kids on the block” and not discriminate against Chinese investment, nor establish protectionist barriers against it.
